Dendritic Cells. Dendritic cells (DCs) get their name from their surface projections (that resemble the dendrites of neurons).. They are found in most tissues of the body and are particularly abundant in those that are interfaces between the external and internal environments (e.g., skin, lungs, and the lining of the gastrointestinal tract) where they are ideally placed to encounter extrinsic ...

### Dendritic Cells - Biology Pages

Dendritic cells ( DCs) are antigen-presenting cells (also known as accessory cells) of the mammalian immune system. Their main function is to process antigen material and present it on the cell surface to the T cells of the immune system. They act as messengers between the innate and the adaptive immune systems .

### Dendritic cell - Wikipedia

Immature dendritic cells in tissues are constantly sampling their microenvironment for the presence of antigens. Upon activation by pathogens and other inflammatory stimuli, dendritic cells undergo phenotypical maturation and migrate toward the secondary lymphoid organs. On reaching these organs, dendritic cells develop into mature cells capable to present antigens to naïve T lymphocytes, thus initiating the development of adaptive immune responses (Dominguez & Ardavin, 2010).

### Dendritic Cell - an overview | ScienceDirect Topics

Dendritic cells (DCs) are antigen-presenting cells derived from bone marrow precursors and form a widely distributed cellular system throughout the body. DCs exert immune-surveillance for exogenous and

endogenous antigens and the later activation of naive T lymphocytes giving rise to various immunological responses.

The second edition of The Macrophage comes at a time of resurgence of interest in innate immunity. The innate immune system depends upon a range of effector cells with genetically determined receptors recognising conserved molecular structures expressed by a wide variety of potential invading organisms, allowing it to distinguish between self and non-self.
