Head Neck And Dental Anatomy

Skin. The head and neck is covered in skin and its appendages, termed the integumentary system. These include hair, sweat glands, sebaceous glands, and sensory nerves. The skin is made up of three microscopic layers: epidermis, dermis, and hypodermis. The epidermis is composed of stratified squamous epithelium and is divided into the following five sublayers or strata, listed in order from outer ...

The facial muscles are striated muscles that attach to the bones of the skull to perform important functions for daily life, including mastication and facial expressions. These muscles are located medially to the ears, superior to the mandible, and inferior to the coronal suture of the skull. Deficits in these muscles can lead to significant impairment of daily function.

Torticollis, also known as wry neck, is a dystonic condition defined by an abnormal, asymmetrical head or neck position, which may be due to a variety of causes. The term torticollis is derived from the Latin words tortus for twisted and collum for neck.. The most common case has no obvious cause, and the pain and difficulty with turning the head usually goes away after a few days, even ...
